

Keep approval tied to the work being delivered.

Use a named completion checkpoint and require a fresh review when material scope changes.

A decision loses meaning if the task changes after approval but retains the same green status.

What changes for your team

- Make reviewer responsibility visible.
- Keep prior decisions while reviewing changed work.
- Prevent completion without the required current-scope approval.

Explore the workflow

- One to five active independent reviewers for ordinary tasks
- Any-reviewer or all-reviewer completion rules
- Supporting source details and retained decision history

Explore Vision at <https://nanox.tv> and arrange a demonstration around one real workflow.

Explore Nano X at nanox.tv or ask your representative for a scoped walkthrough.

Availability depends on your release, permissions, enabled modules and connection setup. Verify the exact workflow before commitment.
