

Connect the work around your existing stack

Keep the systems that work. Make the handoffs inspectable.

A customer may already trust a service desk, source-control platform or planning tool. A productive evaluation identifies the specific handoff Vision can improve and preserves authoritative records in the systems that own them.

What changes for your team

- Explicit ownership of records and decisions
- Fewer ambiguous handoffs between tools
- A staged adoption path with a documented recovery route

Explore the workflow

- Define which system owns each record and which owns the decision.
- Distinguish a reference link, an import, a connected read and an authorized write.
- Review identity, scope, failure handling and reconciliation for every connected action.

Map one handoff across your existing stack with Nano X.

Explore Nano X at nanox.tv or ask your representative for a scoped walkthrough.

Availability depends on your release, permissions, enabled modules and connection setup. Verify the exact workflow before commitment.
