

# Design an evidence-led pilot

Prove one connected outcome before broadening the rollout.

Teams can approve a product after a polished demo and still discover that the real handoffs remain fragmented. A useful pilot starts with a workflow the customer can inspect, repeat and measure.

## What changes for your team

- A shared evaluation plan with measurable acceptance criteria
- An evidence trail from intake through the requested result
- A documented decision on expansion and unresolved gaps

## Explore the workflow

- Choose one request that becomes owned work and requires a recorded decision.
- Agree on a baseline, acceptance criteria, sample records and a named evaluator.
- Include a failed action, changed approval scope and access-restricted record in the rehearsal.

## Agree on one workflow, one accountable evaluator and a review date with Nano X.

Explore Nano X at [nanox.tv](https://nanox.tv) or ask your representative for a scoped walkthrough.

Availability depends on your release, permissions, enabled modules and connection setup. Verify the exact workflow before commitment.
