

# See the whole code delivery chain.

Connect required pull requests to the work and keep merge distinct from delivery.

A feature can span several pull requests. Closing the work after the first merge can leave essential changes, deployment checks or acceptance unfinished.

## What changes for your team

- Inspect multiple PRs from the source work item.
- Make required versus supporting scope explicit.
- Keep repository controls authoritative.

## Explore the workflow

- Multi-PR delivery chains and stack relationships
- Checks, review and blocker observations
- Verified outcome by default, with explicit On merge policy

## Explore Vision at <https://nanox.tv> and arrange a demonstration around one real workflow.

Explore Nano X at [nanox.tv](https://nanox.tv) or ask your representative for a scoped walkthrough.

Availability depends on your release, permissions, enabled modules and connection setup. Verify the exact workflow before commitment.
