

Run a practical governance review

Inspect who can see, decide and act.

Governance is clearest when an evaluator can follow a real decision. Start with role and folder access, then test the approval revision and execution scope rather than relying on a feature label.

What changes for your team

- A role-by-role evaluation of the agreed workflow
- Recorded decisions tied to the reviewed work
- Evidence for an informed security and deployment review

Explore the workflow

- Evaluate access using distinct accounts and an intentionally restricted record.
- Change material work after review and confirm that the required decision is refreshed.
- Inspect an authorized action's result and recovery record without exposing provider credentials.

Bring your access model and evidence checklist to a governance walkthrough.

Explore Nano X at nanox.tv or ask your representative for a scoped walkthrough.

Availability depends on your release, permissions, enabled modules and connection setup. Verify the exact workflow before commitment.
